

**What is claimed is:**

- 1 1. An apparatus, comprising:  
2 a support member; and  
3 a mount coupled to the support member and configured to removably retain an  
4 input device without modification to the input device.
- 1 2. The apparatus of claim 1, the mount being a first mount, the apparatus further  
2 comprising:  
3 a second mount coupled to the support member and configured to couple to an  
4 output device.
- 1 3. The apparatus of claim 1, wherein the mount has a first retention member and a second  
2 retention member, the first retention member and the second retention member are  
3 collectively configured to removably retain the input device on the mount.
- 1 4. The apparatus of claim 1, wherein the mount has a first retention member and a second  
2 retention member, the first retention member is fixedly coupled to the mount, the second  
3 retention member is coupled to the mount and is movable with respect to the first  
4 retention member between a first position and a second position, a distance between the  
5 first retention member and the second retention member when the second retention  
6 member is in its first position is greater than a distance between the first retention

7 member and the second retention member when the second retention member is in its  
8 second position.

1 5. The apparatus of claim 1, wherein the mount has a first retention member and a second  
2 retention member, the first retention member is fixedly coupled to the mount, the second  
3 retention member is movable with respect to the first retention member between a first  
4 position and a second position, a distance between the first retention member and the  
5 second retention member when the second retention member is in its first position is  
6 greater than a distance between the first retention member and the second retention  
7 member when the second retention member is in its second position, the second retention  
8 member is biased to its second position.

1 6. The apparatus of claim 1, wherein the mount has a first elongate member and a second  
2 elongate member, the first elongate member is slideably coupled to the second elongate  
3 member, at least one of the first elongate member and the second elongate member  
4 configured to retain the input device on the mount.

1 7. The apparatus of claim 1, wherein the mount is slideably coupled to the support member  
2 in a first direction, a second direction opposite from the first direction, and a third  
3 direction different from the first direction and the second direction.

1 8. The apparatus of claim 1, wherein the mount is pivotally coupled to the support member  
2 and is configured to pivot from a first position to a second position substantially  
3 perpendicular to the first position.

1 9. The apparatus of claim 1, the support member and the mount collectively defining an  
2 assembly, the apparatus further comprising:

3 an arm having a first portion coupled to the support member and a second portion  
4 coupled to a base, the first portion of the mount arm being movable with respect to the  
5 second portion of the arm,

6 the assembly and the arm collectively having a range of motion including a first  
7 position, a second position, and a third position, the assembly having a first height and a  
8 first orientation when the assembly and the arm are in their first position, the assembly  
9 having a second height and the first orientation when the assembly and the arm are in  
10 their second position, the assembly having a third height and a second orientation when  
11 the assembly and the arm are in their third position.

1 10. The apparatus of claim 1, the support member and the mount collectively defining an  
2 assembly, the apparatus further comprising:

3 an arm coupled to the assembly,

4 the assembly and the arm having a range of motion including a first position, a  
5 second position, and a third position, the assembly positionable and orientable to a  
6 standing position when the assembly and the arm are in their first position, the assembly  
7 positionable and orientable to a seated position when the assembly and the arm are in

8 their second position, the assembly positionable and orientable to a supine position when  
9 the assembly and the arm are in their third position.

1 11. The apparatus of claim 1, wherein the mount is configured to removably retain an input  
2 device for a therapeutic apparatus.

1 12. The apparatus of claim 1, wherein the mount is configured to contact a first side of the  
2 input device and a second side of the input device, the second side of the input device is  
3 parallel to the first side of the input device.

1 13. The apparatus of claim 1, wherein the mount is configured to contact a first side of the  
2 input device and a second side of the input device, the second side of the input device is  
3 opposite the first side of the input device.

1 14. The apparatus of claim 1, the mount being a first mount, the apparatus further  
2 comprising:

3 a second mount coupled to the support member and configured to couple to a  
4 visual output device, the visual output being orientable to a position such that a user of  
5 the input device may view the visual output device.

1 15. The apparatus of claim 1, wherein the input device is a keyboard that includes a plurality  
2 of keys, the mount is configured to removably retain the keyboard such that the plurality  
3 of keys of the keyboard are positioned to be used by a user.

1 16. An apparatus, comprising:  
2 a support member; and  
3 a mount pivotally coupled to the support member and configured to retain an  
4 input device such that the input device has a range of motion including a first position  
5 and a second position, at least one of the first position and the second position being  
6 substantially vertical.

1 17. The apparatus of claim 16, the mount being a first mount, the apparatus further  
2 comprising:  
3 a second mount coupled to the support member and configured to couple to an  
4 output device.

1 18. The apparatus of claim 16, wherein the mount has a first retention member and a second  
2 retention member, the first retention member and the second retention member are  
3 configured to retain the input device on the mount without modification to the input  
4 device.

1 19. The apparatus of claim 16, wherein the mount has a first retention member and a second  
2 retention member, the first retention member is fixedly coupled to the mount, the second  
3 retention member is coupled to the mount and is movable with respect to the first  
4 retention member between a first position and a second position, a distance between the  
5 first retention member and the second retention member when the second retention

6 member is in its first position is greater than a distance between the first retention  
7 member and the second retention member when the second retention member is in its  
8 second position.

1 20. The apparatus of claim 16, wherein the mount has a first retention member and a second  
2 retention member, the first retention member is fixedly coupled to the mount, the second  
3 retention member is coupled to the mount and is movable with respect to the first  
4 retention member between a first position and a second position, a distance between the  
5 first retention member and the second retention member when the second retention  
6 member is in its first position is greater than a distance between the first retention  
7 member and the second retention member when the second retention member is in its  
8 second position, the second retention member is biased to its second position.

1 21. The apparatus of claim 16, wherein the mount has a first elongate member and a second  
2 elongate member, the first elongate member is slideably coupled to the first elongate  
3 member, at least one of the first elongate member and the second elongate member  
4 configured to retain the input device.

1 22. The apparatus of claim 16, wherein the mount is slideably coupled to the support member  
2 in a first direction, a second direction opposite from the first direction, and a third  
3 direction different from the first direction and the second direction.

1 23. The apparatus of claim 16, wherein the mount is configured to contact a first side of the  
2 input device and a second side of the input device, the second side of the input device is  
3 parallel to the first side of the input device.

1 24. An apparatus, comprising:

2 an assembly having a mount configured to retain an input device and a mount arm  
3 having a first portion and a second portion, the first portion being coupled to the mount,  
4 the second portion configured to couple to a support,

5 the assembly having a range of motion including a first position, a second  
6 position, and a third position, the mount of the assembly positionable to a standing  
7 position when the assembly is in its first position, the mount of the assembly positionable  
8 to a seated position when the assembly is in its second position, the mount of the  
9 assembly positionable to a supine position when the assembly is in its third position.

1 25. The apparatus of claim 24, wherein the mount of the assembly has a first height and a  
2 first orientation when the assembly is in its first position, the mount of the assembly has a  
3 second height and the first orientation when the assembly is in its second position, the  
4 mount of the assembly has a third height and a second orientation when the assembly is  
5 in its third position.

1 26. The apparatus of claim 24, wherein the mount of the assembly is configured to retain an  
2 input device associated with a therapeutic apparatus.

- 1    27.    An apparatus, comprising:  
2                    a support member having a mount configured to couple to a first device; and  
3                    a clamp coupled to the support member and configured to removably retain a  
4                    second device, the second device being an input device associated with the first device.
- 1    28.    The apparatus of claim 27, wherein the first device is an output device associated with the  
2                    first device.
- 1    29.    The apparatus of claim 27, wherein the clamp has a first retention member and a second  
2                    retention member, the first retention member and the second retention member are  
3                    collectively configured to removably retain the input device on the clamp.
- 1    30.    The apparatus of claim 27, wherein the clamp has a first retention member and a second  
2                    retention member, the second retention member is movable with respect to the first  
3                    retention member between a first position and a second position, a distance between the  
4                    first retention member and the second retention member when the second retention  
5                    member is in its first position is greater than a distance between the first retention  
6                    member and the second retention member when the second retention member is in its  
7                    second position, the second retention member is biased to its second position.

1    31.    The apparatus of claim 27, wherein the clamp has a first elongate member and a second  
2           elongate member, the first elongate member is slideably coupled to the second elongate  
3           member.

1    32.    The apparatus of claim 27, wherein the clamp is slideably coupled to the support member  
2           in a first direction, a second direction opposite from the first direction, and a third  
3           direction different from the first direction and the second direction.

1    33.    The apparatus of claim 27, wherein the clamp is pivotally coupled to the support member  
2           and is configured to pivot from a first position to a second position, at least one of the  
3           first position and the second position being substantially vertical.

1    34.    The apparatus of claim 27, wherein the mount is configured to couple to an output device  
2           associated with a therapeutic apparatus, the clamp is configured to removably retain an  
3           input device associated with the therapeutic apparatus.

1    35.    The apparatus of claim 27, wherein the clamp is configured to contact a first side of the  
2           input device and a second side of the input device, the second side of the input device is  
3           opposite the first side of the input device.

1    36.    An apparatus, comprising:  
2                    a support member; and  
3                    a mount coupled to the support member and configured to receive an input device  
4                    having a first side and a second side different from the first side,  
5                    the mount being configured to generate a force on the first side of the input device and on  
6                    the second side of the input device when the mount receives the input device.

1    37.    The apparatus of claim 36, the mount being a first mount, the apparatus further  
2                    comprising:  
3                    a second mount coupled to the support member and configured to couple to an  
4                    output device.

1    38.    The apparatus of claim 36, wherein the mount has a first retention member and a second  
2                    retention member, the first retention member and the second retention member are  
3                    collectively configured to generate the force on the first side of the input device and on  
4                    the second side of the input device when the mount receives the input device.

1    39.    The apparatus of claim 36, wherein the mount has a first retention member and a second  
2                    retention member, the first retention member is fixedly coupled to the mount, the second  
3                    retention member is movable with respect to the first retention member between a first  
4                    position and a second position, a distance between the first retention member and the  
5                    second retention member when the second retention member is in its first position is  
6                    greater than a distance between the first retention member and the second retention

7 member when the second retention member is in its second position, the second retention  
8 member is biased to its second position.

1 40. The apparatus of claim 36, wherein the mount is slideably coupled to the support member  
2 in a first direction and a second direction different from the first direction.

1 41. The apparatus of claim 36, wherein the mount is pivotally coupled to the support member  
2 and is configured to pivot from a first position to a second position substantially  
3 perpendicular to the first position.

1 42. A method of positioning an input device on a mount, the mount having a first retention  
2 member and a second retention member, the second retention member being movable  
3 with respect to the first retention member within a range of rotation including a first  
4 position, a second position, and a third position, the method comprising:

5 moving the second retention member of the mount from the first position to the  
6 second position;

7 disposing the input device between the first retention member of the mount and  
8 the second retention member of the mount; and

9 positioning the second retention member of the mount from the second position to  
10 a third position.

- 1    43.    The method of claim 42, the mount being a pivotal mount, the method further  
2           comprising:  
3                  pivoting the mount and the input device from a first orientation to a second  
4           orientation substantially perpendicular to the first orientation.
